1. The transaction Merkle Tree root value in a Bitcoin block is calculated using _____.

1 / 1 point

☐ previous block's hash

☒ hash of transactions

☐ number of transactions

☐ none

Correct

Correct.
2. Follow the steps given in the tool at [this link](#) to manually calculate the hash of the block #490624. You can obtain the details required in the tool from [this link](#).

1 / 1 point

What is the hash of the block #490624? Copy and paste the answer.

000000000000000000d4c8b9d5388e42bf084e29546357c63cba8324ed4ec8bf

Correct

Correct
3. Follow the guidelines in the encryption tool at [this link](#) to better understand the concept of Public-Private key encryption and answer the question below.

1 / 1 point

When encrypting a message with the public key, which key is required to decrypt the message?

☒ Private Key

☐ Public Key

☐ Both Public key and Private key

☐ Inverted Public Key

Correct

Correct
4. What type of hashing algorithm does Bitcoin blockchain use to determine the hash of a block?

1 / 1 point

☒ SHA-256

☐ MD5

☐ SHA-512

☐ SHA-1

Correct

That's correct. Bitcoin uses: SHA256(SHA256(Block_Header))

5. In Ethereum, which algorithm is applied to the private key in order to get a unique public key.

1 / 1 point

☐ SHA 256

☒ ECC

☐ RSA

☐ Keccak

Correct

That's correct. Addresses of account are generated using the public key-private key pair. First, a 256-bit random number is generated and designated as a private key, kept secure and locked using a passphrase. Then an ECC algorithm is applied to the private key to get a unique public key.

6. Which of the following methods can be used to obtain the original message from its generated hash message using SHA-256?

1 / 1 point

☐ Hashing the reverse of generated hash

☐ Hashing the generated hash again

☐ Hashing the generated hash again, twice

☒ Original message cannot be retrieved

Correct

That's correct. SHA-256 is a one-way hash function, that is a function which is infeasible to invert.

7. In Ethereum, hashing functions are used for which of the following?

1 / 1 point

1. Generating state hash.

2. Generating account addresses.

3. Decrypting senders message.

4. Generating block header hash.

☐ 1,2,3

☐ 2,3,4

☒ 1,2,4

☐ 1,3,4

Correct

That's correct. In Ethereum, hashing functions are used for generating account addresses, digital signatures, transaction hash, state hash, receipt hash, and block header hash.

8. What is the purpose of using a digital signature?

1 / 1 point

☐ It supports user authentication

☒ It supports both user authentication and integrity of messages

☐ It supports the integrity of messages

☐ None of the above.

Correct

That's correct. A valid digital signature gives a recipient reason to believe that the message was created by a known sender (authentication), that the sender cannot deny having sent the message, and that the message was not altered in transit (integrity).

9. Encryption of a message provides _____.

1 / 1 point

☐ authentication

☒ security

☐ nonrepudiation

☐ integrity

Correct

Correct.

10. A public key is derived from the _____.

1 / 1 point

☐ genesis block hash

☐ a different public key

☐ hash of the first transaction by the account

☒ private Key

Correct

Correct!
